Tree Identification Trail Guide

Trees are among the largest and most useful plants on earth. Collectively, trees comprise forests that provide food, shelter and innumerable benefits for native wildlife and humans alike. From the Smokey Mountains in East Tennessee to the Mississippi River in the West, few states have as many tree species as Tennessee. Because forests and trees were so important in the development of the State and contribute so much to our present wealth and prosperity, Tennesseans ought to be able to recognize trees that grow here, especially native species. We hope this tree identification trail will be a useful tool for schools, Boy and Girl Scouts, and families in learning to identify trees and their values.

One or more trees

Representative of species present at the Arboretum are tagged along the perimeter trail and along sections of the trail that connect Deerwood with Belle Rive Drive and the foot bridge over the Little Harpeth River that leads to Kingsbury Drive in Laurelwood. Most tagged trees are within 20 feet of the trail, and only a few more than 50 feet from the trail. Tree tags have an assigned number and the common and scientific name, including the genus and trivial (species) name, of the tree. Most tagged trees are native to Tennessee; exceptions are footnoted. A map of the Arboretum that shows approximate locations of tagged trees is posted near the entrance gate to the Arboretum. Numbers of species listed in this brochure correspond with numbers on tree tags and the map.
